

BiteFixes SaaS - Master Recommendations

Purpose

This document summarizes the recommended long-term architecture and development guidelines for BiteFixes SaaS.

Vision

Build a scalable multilingual SaaS platform centered on Bitey as the AI orchestration engine.

Architecture

Use Clean Architecture: Presentation -> API -> Bitey Core -> Services -> Repositories -> Supabase.

Standards

Keep database, API, source code, variables and functions in English. User interface must support English, Spanish and Portuguese. Comments may be trilingual.

Recommended Modules

Companies, Customers, Customer Devices, Services, Knowledge Base, Conversations, Messages, Tickets, Notifications, AI Logs, Profiles, Users, Integrations.

Bitey Responsibilities

Session management, memory, intent detection, knowledge retrieval, workflow orchestration, AI provider integration, translations, notifications and analytics.

Documentation

Maintain a docs folder with project overview, architecture, database, backend, AI, workflows, API, security, deployment, coding standards and roadmap.

Roadmap

1. Rebuild database. 2. Implement repositories. 3. Implement services. 4. Rebuild Bitey Core. 5. Expose FastAPI. 6. Integrate WhatsApp, WordPress and mobile apps. 7. Deploy and monitor.

Recommendation

Avoid continuing on mixed-language legacy structures. Complete the canonical English schema first, then update the Python backend against the new schema to reduce technical debt.
